

# NJIT

The logo features the letters 'NJIT' in a large, white, serif font. A thick, white, curved line starts under the 'J' and sweeps upwards and to the right, ending under the 'T'.

# **CS 280**

# **Programming Language Concepts**

## **Programming Notes**

## **cctype**

# cctype

- standard header file in C++ distribution
- useful utilities for character classification

# Testing letters

- Does a particular variable contain a letter?

```
char ch;
```

```
if( ch == 'a' || ch == 'b' || ch == 'c' || ...  
    // that works... but it's hard to type,  
    // annoying to read, and error prone
```

```
if( ch >= 'a' && ch <= 'z' )  
    // that's better.. as long as letters are  
    // contiguous from a-z (true for ascii)
```

# cctype: character classification

```
char ch;
```

```
if( islower(ch) ) // much better!
```

- `islower(ch)` // true if lowercase
- `isupper(ch)` // true if uppercase
- `isdigit(ch)` // true if a digit
- `isalpha(ch)` // true if a letter
- `isalnum(ch)` // true if letter or num

# Converting case

- Converting from lower case to upper case

```
'A' + ch - 'a'
```

```
// correct! but quite cryptic!
```

```
toupper(ch)
```

```
// much easier to read
```

```
// checks to make sure ch islower() first
```

There is also a `tolower()`

# How could we implement ctype?

- logical test in function or macro
  - implement the logic test every time you need to test or convert a character
  - calling a function every time incurs a cost
  - can avoid this with inline functions or preprocessor macros
- a table lookup
  - at a cost of some space, a VERY fast implementation as an array lookup
